SHADOW - Main Result

Calculation: VKA ondergrens 220425

Total amount of flickering on the shadow receptors caused by each WTG

No.	Name	Worst case [h/year]	Expected [h/year]
1	VESTAS V150-4.2 4200 150.0 !O! hub: 140,0 m (TOT: 215,0 m) (63)	342:17	47:10
2	VESTAS V150-4.2 4200 150.0 !O! hub: 140,0 m (TOT: 215,0 m) (64)	267:27	43:44
3	VESTAS V150-4.2 4200 150.0 !O! hub: 140,0 m (TOT: 215,0 m) (65)	304:26	45:32
4	VESTAS V150-4.2 4200 150.0 !O! hub: 140,0 m (TOT: 215,0 m) (66)	421:03	66:32

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

SHADOW - Main Result

Calculation: VKA bovengrens 220425
Assumptions for shadow calculations

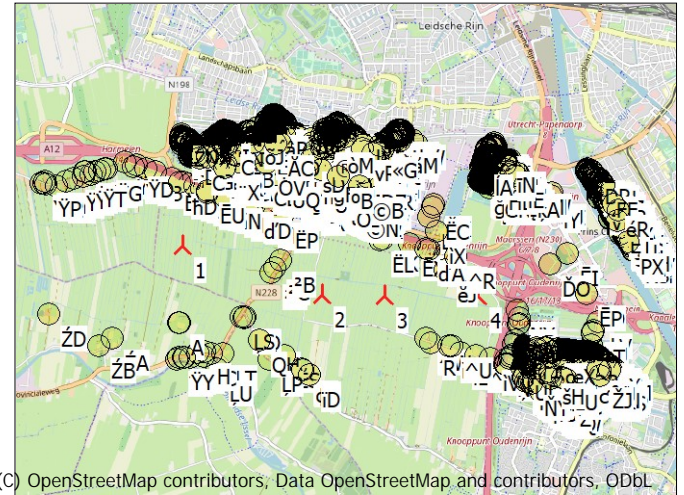

Maximum distance for influence
Calculate only when more than 20 % of sun is covered by the blade
Please look in WTG table

Minimum sun height over horizon for influence 5 °
Day step for calculation 1 days
Time step for calculation 1 minutes

Sunshine probability S (Average daily sunshine hours) [DE BILT]

SHADOW - Main Result

Calculation: VKA bovengrens 220425

Total amount of flickering on the shadow receptors caused by each WTG

No.	Name	Worst case [h/year]	Expected [h/year]
1	LD Custom User 6200 180.0 !O! hub: 180,0 m (TOT: 270,0 m) (59)	645:14	89:54
2	LD Custom User 6200 180.0 !O! hub: 180,0 m (TOT: 270,0 m) (60)	446:19	74:19
3	LD Custom User 6200 180.0 !O! hub: 180,0 m (TOT: 270,0 m) (61)	544:08	82:41
4	LD Custom User 6200 180.0 !O! hub: 180,0 m (TOT: 270,0 m) (62)	543:22	88:12

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.
